

The Definite Integral:

$$\int_a^b f(x) dx =$$

The net signed area between $y=f(x)$ & x -axis & bounded on left by $x=a$ & by $x=b$ on right.

Understanding Signed Areas:

area is completely above x -axis

↑↑
+ve area

area is completely below x -axis

↑↑
-ve area

area is partially above & partially below x -axis.

A is -ve area
B is +ve area

So, total area is $(-A+B)$

Example: Find the following area:

semicircle has diameter 4, so area = $\pi \cdot \left(\frac{d}{2}\right)^2$
(in yellow) (d)
 $= \pi \cdot \left(\frac{4}{2}\right)^2$
 $= \pi \cdot 4 = 4\pi$

⇒

triangle has base 4 & height 2, so area = $\frac{1}{2}(\text{base})(\text{height})$
 $= \frac{1}{2}(4)(2)$
 $= 4$

So required area is $(-4\pi+4)$.

Note:- Integrals are basically of two types:

- ① Definite Integral \rightsquigarrow measures area (a real number)
- ② Indefinite integral \rightsquigarrow provides an antiderivatives (a function)

Left & Right Riemann Sums:-

$$\int_a^b f(x) dx \rightsquigarrow \begin{aligned} &\bullet \text{ for such problem our interval is } [a, b]. \\ &\bullet \text{ divide } [a, b] \text{ in } n \text{ subintervals } [x_0, x_1], [x_1, x_2], \dots, [x_{n-1}, x_n] \\ &\bullet \text{ then } \Delta x = \frac{b-a}{n} \end{aligned}$$

So, Left Riemann Sum (L_n) is

$$L_n = \underset{\substack{\uparrow \\ \text{left end point} \\ \text{of } [x_0, x_1]}}{f(x_0)} \cdot \Delta x + \underset{\substack{\uparrow \\ \text{left end point} \\ \text{of } [x_1, x_2]}}{f(x_1)} \cdot \Delta x + \dots + \underset{\substack{\uparrow \\ \text{left end point} \\ \text{of } [x_{n-1}, x_n]}}{f(x_{n-1})} \cdot \Delta x$$

So, Right Riemann Sum (R_n) is

$$R_n = \underset{\substack{\uparrow \\ \text{right end point} \\ \text{of } [x_0, x_1]}}{f(x_1)} \cdot \Delta x + \underset{\substack{\uparrow \\ \text{right end point} \\ \text{of } [x_1, x_2]}}{f(x_2)} \cdot \Delta x + \dots + \underset{\substack{\uparrow \\ \text{right end point} \\ \text{of } [x_{n-1}, x_n]}}{f(x_n)} \cdot \Delta x$$

Note: $\int_a^b f(x) dx = \lim_{n \rightarrow \infty} L_n = \lim_{n \rightarrow \infty} R_n$

Example: Let $f(x) = x\sqrt{x^3+1}$. Find L_5 & R_5 on the interval $[0, 5]$.

Here, $\Delta x = \frac{b-a}{n} = \frac{5-0}{5} = 1$

So, $L_5 = \Delta x \cdot f(0) + \Delta x \cdot f(1) + \Delta x \cdot f(2) + \Delta x \cdot f(3) + \Delta x \cdot f(4)$

$R_5 = \Delta x \cdot f(1) + \Delta x \cdot f(2) + \Delta x \cdot f(3) + \Delta x \cdot f(4) + \Delta x \cdot f(5)$

Properties related to Definite Integral:

$$\textcircled{1} \int_a^a f(x) dx = 0$$

$$\textcircled{2} \int_a^b f(x) dx = - \int_b^a f(x) dx$$

$$\textcircled{3} \text{ If } a \leq c \leq b, \text{ then } \int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$$

$$\textcircled{4} \int_a^b (f(x) \pm g(x)) dx = \int_a^b f(x) dx \pm \int_a^b g(x) dx$$

$$\textcircled{5} \int_a^b c f(x) dx = c \int_a^b f(x) dx, \text{ where } c \text{ is a constant.}$$
